

Oppose SB372 & HB1232

Please vote **unfavorable** on the above bills. Pharmacists do not have the necessary training to obtain the full medical history from each patient before administering vaccines to most of their pediatric patients/customers. There have been multiple occasions where I needed to refresh my children's own pediatrician on certain important data. This bill would enable pharmacists to administer vaccines to small children without reviewing the child's medical chart, assessing contraindications, or evaluating the condition of the patient in the hours and days following the administration of the vaccine. There will also be less adverse reactions reported.
